## Practice quiz on Exponents and Logarithms

TOTAL POINTS 12

- 1. Re write the number  $784 = 2 \times 2 \times 2 \times 2 \times 7 \times 7$  using exponents.
  - $\bigcirc$   $(2 \times 7)^6$
  - $(2^4)(7^2)$
  - $\bigcirc$  (16<sup>4</sup>)(49<sup>2</sup>)  $\bigcirc$  (2<sup>6</sup>)(7<sup>6</sup>)

Correct
For this type of problem, count the number of times each relevant factor appears in the product. That number is the exponent for that factor.

- **2.** What is  $(x^2 5)^0$ ?
- 1
- $(x^2) 5$
- $\bigcirc$  -4
- $\bigcirc$   $(x^2)$

 $\checkmark$  Correct Any real number (except zero) raised to the "zeroith" power =1.

- 3. Simplify  $((x-5)^2)^{-3}$
- $(x-5)^{-5}$
- $(x-5)^{-1}$
- $\bigcirc (x-5)$

 $(x-5)^{-6}$ 

✓ Correct

By Rule 2, "Power to a Power," multiply the exponents and get:

$$(x-5)^{(2\times-3)} = (x-5)^{-6}$$

- 4. Simplify  $(\frac{8^2}{8^7})^2$
- $\odot$   $8^{-10}$
- $\bigcirc$   $8^{-4}$
- $\bigcirc$   $8^{-1}$
- $\bigcirc$  8<sup>-5</sup>

We can first simplify what is inside the parenthesis to  $8^{-5}$  using the Division and Negative Powers Rule.

Then apply division and negative powers— the result is the same.  $\frac{8^4}{8^{14}}=8^{-10}$ 

$$\frac{8^4}{14} = 8^{-10}$$

**5.**  $\log 35 = \log 7 + \log x$ 

Solve for x

- O 4
- O 7
- 28 5

✓ Correct  $\log(x) = \log 35 - \log 7$ 

 $\log(x) = \log \left(\frac{35}{7}\right)$ 

By the Quotient Rule  $\log x = \log 5$ 

Solve for x $\bigcirc \ \ x=2 \ \mathsf{or} \ x=3$ ✓ Correct We use the property that  $b^{\log_b a} = a$ Use both sides as exponent for 2.  $2^{\log_2 x^2 + 5x + 7} = 2^0$  $x^2 + 5x + 7 = 1$  $x^2 + 5x + 6 = 0$ (x+3)(x+2)=0 $x=-3\ \mathrm{OR}$ x = -27. Simplify  $\log_2 72 - \log_2 9$ 1 / 1 point 3  $\bigcirc \log_2 4$  $\bigcirc \ \log_2 63$  $\bigcirc$  4 ✓ Correct By the quotient rule, this is  $\log_2 \frac{72}{9} = \log_2 2^3 = 3$ 8. Simplify  $\log_3 9 - \log_3 3 + \log_3 5$ 1 / 1 point  $\bigcirc \log_3 8$ O 8  $\odot \log_3 15$ O 15 ✓ Correct By the Quotient and Product Rules, this is  $\log_3 \frac{9 \times 5}{3} = \log_3 15$ 9. Simplify  $\log_2(3^8 \times 5^7)$ 1 / 1 point  $\bigcirc \ 56 \times \log_2 15$  $\bigcirc \ (5 \times \log_2 3) + (8 \times \log_2 5)$  $\bigcirc$  15  $\times \log_2 56$  $\checkmark$  Correct We first apply the Product Rule to convert to the sum:  $\log_2(3^8) + \log_2(5^7).$  Then apply the power and root rule. **10.** If  $\log_{10}y=100$ , what is  $\log_2y=$ ? 1/1 point O 20 332.19 301.03 O 500 Use the change of base formula,  $\log_a b = \frac{\log_x b}{\log_x a}$ Where the "old" base is  $\boldsymbol{x}$  and the "new" base is  $\boldsymbol{a}$ . So  $\frac{100}{\log_{10}(2)} = \frac{100}{0.30103} = 332.19$ 

1 / 1 point

**6.**  $\log_2(x^2 + 5x + 7) = 0$ 

11. A tree is growing taller at a continuous rate. In the past 12 years it has grown from 3 meters to 15 meters. What is its rate of growth per year?

○ 13.41%

○ 11.41%

○ 12.41%

○ 10.41%

12. Incorrect

□ ln \frac{15}{12} = 0.1341

12. Bacteria can reproduce exponentially if not constrained. Assume a colony grows at a continually compounded rate of 400% per day. How many days before a colony with initial mass of 6.25 × 10<sup>-10</sup> grams weights 1000 Kilograms?

○ 875 days

○ 87.5 days

○ 8.75 days

○ 8.75 days

○ 8.75 days

○ 8.75 days

 $4t = \ln\left(\frac{10^6}{(6.25 \times 10^{-10})}\right) = 35.00878$ 

 $t = \ln \frac{10^6}{6.25 \times 10^{-10}} = 8.752195$
